SUMMARY

Computer Science and Engineering student specializing in Java, building LLM applications and Python backends: a CrewAI resume analyzer with three sequential agents, an n8n + LLM Telegram bot, and a vision app with a schema-validated LLM layer, built with Claude as a coding agent. Also builds real-time systems with Node.js, Redis and Docker.

EDUCATION

B.Tech, Computer Science and Engineering — NMAM Institute of Technology, Nitte 2024 – 2028

TECHNICAL SKILLS

AI & LLMs: LLM APIs (Gemini, Claude), prompt engineering, CrewAI multi-agent workflows, n8n, structured outputs
Languages: Java (primary), Python, JavaScript, SQL
Backend & Data: FastAPI, Pydantic, REST APIs, Node.js, Express.js, Socket.IO, SQLite, MongoDB, Redis
Frontend & Tools: React, HTML, CSS, Docker, Git, GitHub, Render, Vercel, AI coding agents (Claude)

PROJECTS

Multi-Agent AI Resume Analyzer | *Python, CrewAI, LLM APIs*

- Built a sequential three-agent CrewAI pipeline that compares a resume with a job description: the agents handle keyword matching, an estimated ATS-compatibility score, and an evidence-based eligibility assessment in turn.
- Constrained the eligibility agent to a fixed three-way verdict (Eligible, Not Eligible, Insufficient Information), so missing resume evidence produces an explicit “Insufficient Information” instead of an inferred judgment.

Reality Debugger | *Python, FastAPI, Pydantic, React, ONNX Runtime, LLM APIs* github.com/Infernooooooo7/reality-debugger

- Built with Claude as an AI coding agent: a web app that turns a camera feed, photo or video into a bug report for a physical scene, using on-device detection (EfficientDet-Lite0, YOLOX-S) and ByteTrack tracking feeding a FastAPI rule engine.
- Added an optional LLM layer (Gemini, Claude or OpenAI-compatible) with Pydantic-validated JSON output; calls are capped at 6 per minute with a cooldown, a 2-min cache and error back-off, and local results stand if the LLM fails.

Telegram Translation & Voice Bot | *n8n, LLM API, Telegram, Text-to-Speech*

- Automated Telegram translation with an n8n workflow that takes incoming text messages and voice notes, translates them with an LLM, and replies in the same mode: text for text, synthesized speech for voice notes.
- Added validation and fallback branches so empty or unusable translations return a clear failure message instead of a broken reply, plus per-user preference handling.

PhishForensics | *Python, FastAPI, SQLite, VirusTotal API, ReportLab, React* github.com/Infernooooooo7/teamCrackers

- Wrote the FastAPI engine of our hackathon entry: it parses raw emails, flags sender / Return-Path mismatches, expands redirects, and scores each URL on 11 weighted signals such as homograph similarity, entropy and raw-IP hosts.
- Queried the VirusTotal v3 API only for URLs above a local risk threshold and cached verdicts in SQLite to limit calls to the rate-limited service; also built the Chrome extension client and ReportLab PDF reports.

Pixel Duel | *React, Node.js, Express, Socket.IO, MongoDB, Redis, Docker* github.com/Infernooooooo7/1v1-coding-battle

- Developed a real-time 1v1 coding-battle platform where Socket.IO carries match events and a Redis sorted-set queue pairs players by Elo rating; ratings are recalculated and stored in MongoDB after each match.
- Built a Dockerized judge microservice that compiles and runs submissions in Python, JavaScript, C++ and Java against test cases, enforcing execution timeouts, output caps, and code-size and test-case limits.

HACKATHONS & CERTIFICATIONS

- **BugBash 2026 (Aayam), Newton School of Technology, Bengaluru:** 24-hour national hackathon (Apr 2026) as Team Crackers; built PhishForensics.
- **Hackdays (MLH × Google Gemini × ACM):** shortlisted team project VeriTrail (6-hour build), verifying documents with content-bound cryptographic signatures and Gemini as an advisory second opinion.
- **Certifications (Aug 2025):** Microsoft Azure AI Fundamentals; IBM SkillsBuild Data Concepts; Infosys Springboard Java
